Formaldehyde RHF/CIS · common-ground-Eckart-slice double-harmonic model
Unit Condon probabilities; no absolute dark-state absorption or Herzberg–Teller intensity
Endpoint mode overlap: diagnostic only
Final mode index
Ground mode index
Squared matrix element
max |JᵀJ − I| = 0.03243
Canonical rotation of the common-slice model
The projection changes the harmonic model
Model − original excited frequency / cm⁻¹
Final mode index
Model 0–0: 4.398663 eV
Original X10: 4.402847 eV
Unit-Condon probability envelope
Gaussian σ = 0.02 eV
Gaussian σ = 0.01 eV
Model 0–0
Probability density / eV⁻¹
Photon energy / eV
Twenty largest raw Franck–Condon factors
Transition probability
Energy above model 0–0 / eV
Raw weight and spectral convergence
Unresolved total probability
Profile change (larger of two σ)
Probability-tail gate
Missing probability / relative L1 change
Maximum total vibrational quanta
