GaAs · four GW schemes in one finite source model

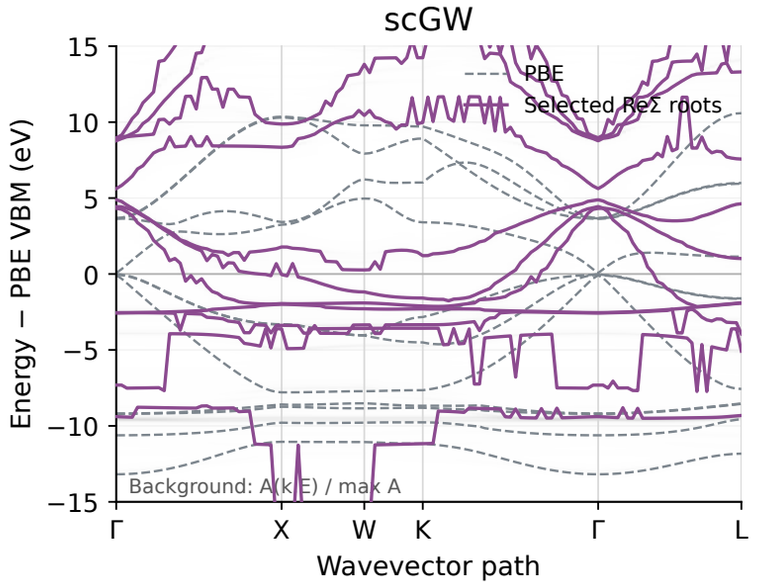

gth-szv · source k mesh (2, 1, 1) · FFT (21, 21, 21) · common PBE-VBM energy zero

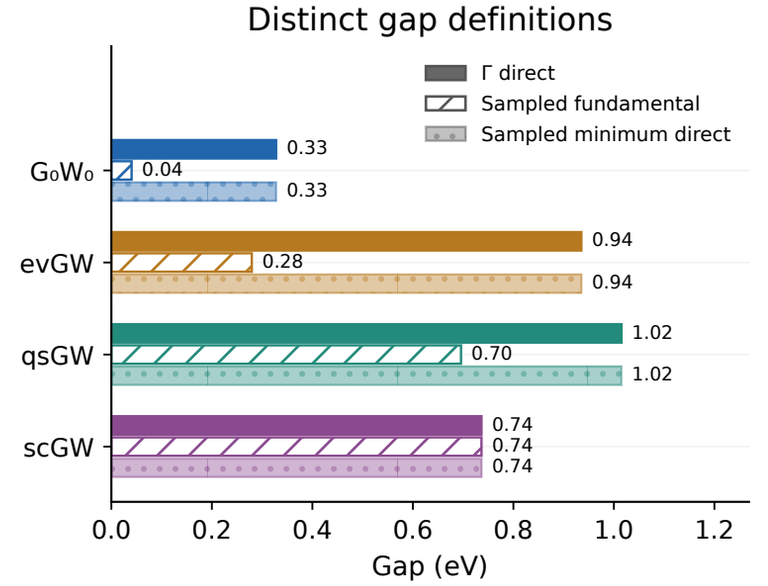

Interpolated operators in a finite SZV/source-k model; no spin–orbit coupling; no bulk-convergence claim. Body-only fc=False; static QP curves and continued interacting scGW have different DOS definitions.

fc=False; scGW β=400 Ha⁻¹; DOS broadening=0.1 eV. Missing/nonfinite values are omitted; gap bars use reported definitions.

scGW lines and gap bars: selected finite-η ReΣ Dyson roots, not certified principal peaks. Local Z is not physical spectral weight. Imaginary-axis/N/PSD checks do not establish real-axis stability.
