Saved material band structures · semilocal overview
GTH-DZVP-MOLOPT-SR / GTH-PBE · no spin–orbit coupling

Shown: matched-setting groups within each material. Per-material figures also include compact hybrids, failed GaN r²SCAN, 2D slabs and direct Si GW points.
Each semiconductor uses its saved occupied-band maximum; graphene uses its saved chemical potential. Display window: −12 to 10 eV; saved files retain every band.
Saved finite models; basis, k mesh, FFT grid and vacuum convergence are not established.
