GaAs · four GW schemes in one finite source model

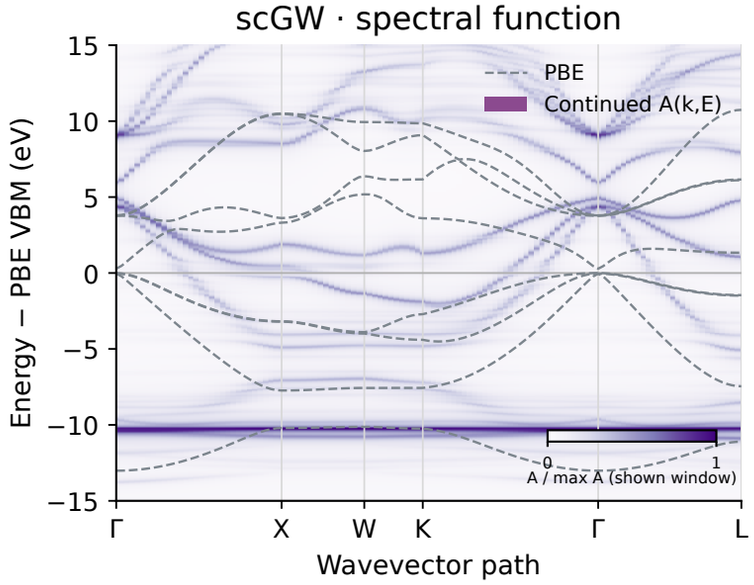

gth-szv · source k mesh (2, 1, 1) · FFT (61, 61, 61) · common PBE-VBM energy zero

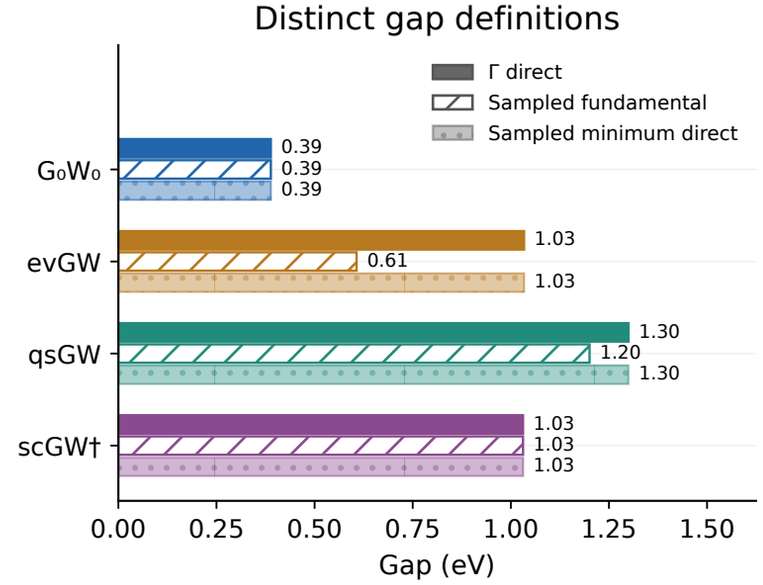

Interpolated operators in a finite SZV/source-k model; no spin–orbit coupling; no bulk-convergence claim. Body-only fc=False; static QP curves and continued interacting scGW have different DOS definitions.

fc=False; scGW β=400 Ha⁻¹; DOS broadening=0.1 eV. Missing/nonfinite values are omitted; gap bars use reported definitions.

scGW: continued spectral density; † gap bars use selected finite-η ReΣ roots. Principal-peak identity and real-axis stability are not certified. Spectral colors use square-root normalization; local Z is not physical spectral weight.
